Pre-trained on huge amount of internet data.

⇒ Token Prediction

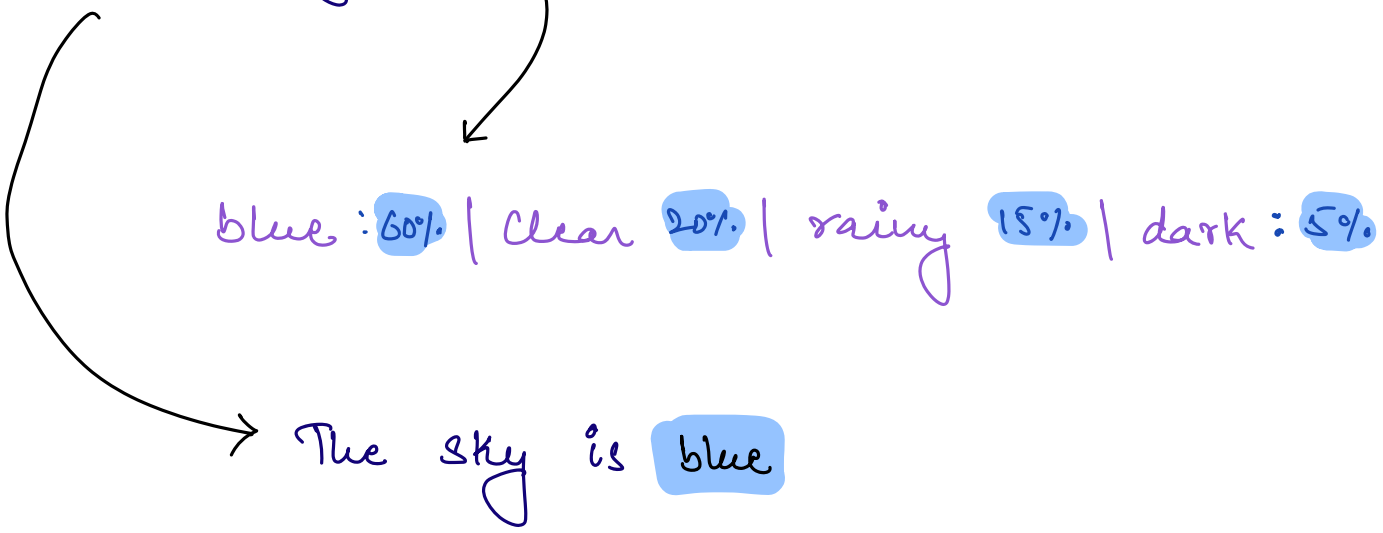

How the whole response get generated ?

→ Reads the input coming from the user.

→

Ex: The sky is [?]

⇒ LLMs core operation is to predict next set of tokens based on their pre-trained information.

⇒ Once the generation of text is completed, LLM stops predicting.

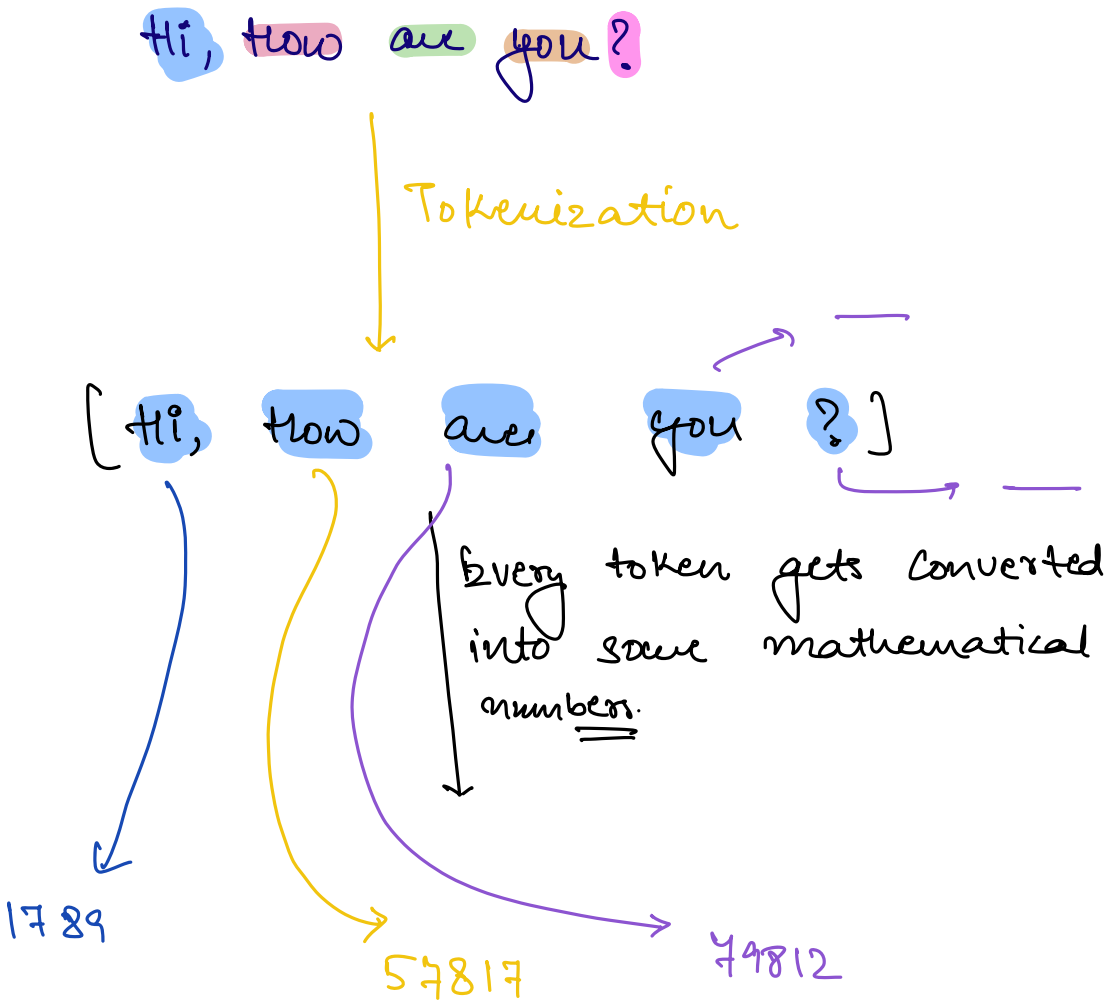

⇒ Embeddings.

Tokenization

Hi, how are you? ⇒ 6 tokens.

Unbelievable

⇒ A tokenizer splits text into tokens before the model processes it, and each token gets converted into a number.

⇒ Tokens are usually subwords; common words can be considered as one token & rare or big words can be divided into several tokens.

⇒ Roughly four characters of English language are considered as one token.

⇒ Image → Pixels.

→ 1080p ⇒ 1920 × 1080
